The DV Traveler compact, shock absorbing support is the solution for lightweight yet extremely solid camera support. The telescoping shoulder arch can extend, retract, and rotate to the videographers perfect position. The support belt and shock-absorbing pod help stabilize your shot. This unit can also fold flat or completely remove the shoulder arch with no tools for storage or travel.

Support Pod**

Velcro Belt

Assembly & Operation

1. The unit will come partially pre-assembled and folded down flat for shipping and storage. Loosen the large black dial above the spring located on the front of the rig. Swing this piece downward until it stops, tighten this dial again to "lock" the rig into shooting mode. Adjusting this large dial will affect the lateral position of the quick release plate and also provide some friction for your tilting movement.

2. Loosen the brass screw on the side of the quick-release plate, pull the silver plunger on the opposite side and remove the top plate. Attach this plate to your camera via the supplied screw. Notice that both the plate portion attached to your camera and the boot portion, attached to the rig, have several mounting positions. Try different combinations to achieve the optimal balance. Small adjustments can be made via the brass screw.

3. Finally, loosen the silver tumbler located on the center of the shoulder column. Slip the rod end of the shoulder arch into the opening, slide to your desired length and tighten the tumbler again. This handy adjustment for comfort can be made easily while wearing the rig.

4. When you are ready to shoot, seat the flat end of the rod through the d-clip and into the pouch. Slide the brass tip of the support pod into the spring below the large black dial. Loosen the tension knobs on the support pod to achieve the desired dampening effect on your movements.

Warranty

This product is covered by a one year manufacturers warranty covering any defects or missing parts. All additional or replacement parts will incur additional cost.
